1.0 Introduction: History of the MARC Congestion Management Process

Federal regulation requires that a congestion management process shall be developed, established, and implemented as part of the metropolitan transportation planning process. The development of a congestion management process should result in multimodal system performance measures and strategies that can be reflected in the metropolitan transportation plan (MTP) and transportation improvement program (TIP).

On December 18, 2001, the MARC Board of Directors adopted a Congestion Management System (CMS) policy to be compliant with the Federal regulations adopted as part of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). In 2005, the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) transportation bill was signed into law. Along with this, various changes were made to the Federal regulations pertaining to metropolitan planning, including a change in requirements from MPOs having a CMS to having a Congestion Management Process (CMP). In MARC’s 2009 Triennial Certification Review, the U.S. Department of Transportation (USDOT) identified the need for MARC to update the region’s CMP. As a result, MARC adopted a new CMP policy on May 24, 2011.

The 2011 CMP policy provides a framework for how MARC will address the Federal CMP requirements and meet the unique needs of the Kansas City metropolitan area. It defines the relationship of CMP to the regional LRTP, TIP, corridor studies, and regional Intelligent Transportation Systems (ITS) architecture. As part of the regional architecture development process, and subsequent updates, outreach is conducted to a range of agencies in the region. These include state, regional and local transportation agencies as well as first responders and emergency management agencies. This provides an opportunity to identify projects for the CMP that may not otherwise be included. In addition ITS projects must be included in the regional architecture in order to be eligible for Federal funding.

The MARC CMP describes an eight-step regional CMP framework consistent with the official guidance issued by the USDOT:

1. Develop congestion management objectives
2. Identify area of application
3. Define system/network of interest
4. Develop performance measures  
5. Institute system performance monitoring plan  
6. Identify and evaluate strategies  
7. Implement selected strategies and manage transportation system  
8. Monitor strategy effectiveness  

Figure 1.1 presents a broader look at how the CMP fits into the transportation planning process.

To go along with this updated CMP, MARC prepared this update Congestion Management Toolbox in 2013. This Toolbox builds on the one previously created in 2001. That original Toolbox was developed as a component of the CMS to provide a reference of alternative strategies to consider in corridor studies and NEPA documents. A wide range of congestion reduction strategies applicable to the Kansas City region was documented in the toolbox, organized into eight categories. This updated Toolbox expands the number of categories; adds more contemporary strategies; and includes additional information of relevance to practitioners.

Figure 1.1  CMP and the Overall Planning Process

2.0 Congestion Management Toolbox

2.1 Using the Toolbox

When local agencies in the region find themselves considering roadway capacity projects, they can use the Toolbox like a checklist. They will consider each item in the Toolbox and, in turn determine whether a strategy (or package of strategies) and the relevant actions/projects have a reasonable potential for providing benefit to the corridor or study area being evaluated. If a strategy shows promise, it can be evaluated in detail using the regional model and applicable post-processing tools suggested in the toolbox.

To select the right types of strategies, an agency must have an understanding of the nature of the need. Figure 2.2 identifies the different dimensions of congestion: what is the issue that needs to be solved? Next, what is the agency trying to accomplish through a strategy: what are the goals and objectives? What would be the measure of success after the strategy has been implemented? Is the focus of the agency long or short term in relation to the need being addressed?

As shown in Figure 1.1 previously, the CMP is integrated into the establishment of goals and objectives, identification and evaluation of alternative strategies, and then developing the LRTP and TIP. The CMT can be used to support this process.

However, there are other ways in which the CMT can be used by agencies in the Kansas City region at a more localized level:

- Identify alternative strategies for addressing local congestion issues, and select the most appropriate of these strategies for the specific issues based on the information in the toolbox;
- After identifying the best strategies for a particular need based on this initial screen, perform more analysis using some of the tools identified; and
- Present national best practices and typical outcomes experienced in other cities to stakeholders, the public, government officials, developers, and others.
Figure 2.1  Different Dimensions of Congestion

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
<th>Image</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spatial</td>
<td>How much of the system is congested? The image presents an example of a metropolitan highway network with 20 percent of all miles congested.</td>
<td></td>
</tr>
<tr>
<td>Temporal</td>
<td>How long does congestion last? The image presents an example of a metropolitan highway network with congestion from 6:00 a.m. through 10:00 a.m.</td>
<td></td>
</tr>
<tr>
<td>Severity</td>
<td>How much delay is there or how low are travel speeds? The image shows that for the same percentage of miles congested, the number of vehicles and total hours of vehicular delay can be different.</td>
<td></td>
</tr>
<tr>
<td>Variability</td>
<td>How does congestion change from day to day? The image shows how the severity and location of congestion can change from day to day. More variation in travel time indicates less reliable travel. A reliable system would have consistent levels of congestion from hour to hour and day to day.</td>
<td></td>
</tr>
</tbody>
</table>

2.2 STRATEGIES

Table 2.1 provides a summary of the types of strategies described in the toolbox. Each strategy type is described in greater detail below, and the strategies themselves are detailed in Tables 2.2 through 2.10.

In these tables, readers will find:

- A list of the projects and strategies;
- How they reduce congestion and how they should be analyzed in specific locations;
- Tools that can be used to do this evaluation;
- Order-of-magnitude cost estimates to assist in selecting the best strategy; and
• Suggestions regarding which strategies are complementary and in what situations they are best used together.

For each of the projects and strategies, the potential for congestion reduction benefits is indicated, along with a recommended analysis method to help with location-specific assessment and prioritization. This includes the tools needed to evaluate the congestion reduction potential of each strategy or project. Tools include the Travel Demand Management (TDM) Evaluation Model, ITS Deployment Analysis System (IDAS), Tool for Operations Benefit/Cost (TOPS-BC), the MARC regional travel model, and others. In some cases, benefits may be more qualitative for selected strategies.

The congestion reduction impacts are defined qualitatively by indicators such as the potential reduction of single occupant vehicles (SOV), improved travel times, and reduced delay. This includes both recurring delay – delay that occurs on a regular basis, such as that due to daily peak congestion – and non-recurring delay – delay that occurs unexpectedly, such as due to crashes or special events. About half of all congestion is non-recurring.

Order-of-magnitude cost estimates also help in selecting between strategies. National cost data built into the TOPS-BC software, IDAS, and other national practices are used to provide this estimate. Therefore, these costs may vary for the Kansas City region. The implementation costs and schedules consider design and maintenance costs, interjurisdictional agreements, and implementation timing over short-term (one to five years), medium-term (five to 10 years), and long-term (over 10 years).

Finally, the Toolbox indicates strategies that are complementary, and in what situations they are best used together.

**Access Management Strategies**

Access management is a broad concept that can include everything from curb cut restrictions on local arterials to minimum interchange spacing on freeways. Restricting turning movements on local arterials can reduce crashes and prevent turning vehicles from impeding traffic flow; this can then make it easier to effectively apply ITS and transportation system management (TSM) strategies in the Transportation Operations and Management category. Similarly, eliminating merge points and weaving sections at freeway interchanges increases the capacity of the facility. Tradeoffs exist in limiting access to individual properties and increasing system mobility, and many communities assign different access restrictions to different functional classifications of roadway (Figure 2.3). The access management strategies listed in Table 2.7 are applicable to Kansas City, and can be used in either the modification or original design of a facility.
Figure 2.2  Tradeoffs in Access and Mobility

Source: FHWA, Introduction to Access Management Principles

Active Transportation

Investments in non-motorized modes of transportation, such as biking and walking, can increase safety and mobility in a cost-efficient manner, while providing a zero-emission alternative to motorized modes (Figure 2.4). The strategies listed in Table 2.4 can be implemented in the Kansas City area with relatively little cost, but tend to have local rather than systemwide impacts. The effectiveness of an investment in non-motorized travel depends heavily on coordination with local land use policies and connections with other modes, such as transit, for longer distance travel. Safety and aesthetics should also be emphasized in the design of bicycle and pedestrian facilities in order to increase their attractiveness.
Figure 2.3  Active Transportation: Bicycle Lanes and Sidewalks

Source: www.peopleforbikes.org

Highway Strategies

Table 2.4 presents the potential highway infrastructure strategies that may be applicable for the Kansas City region. These are often higher-cost strategies that also tend to have larger congestion benefits in the short term. These strategies can sometimes be paired with ITS and transportation system management (TSM) strategies within the Transportation Operations and Management category. Several highway strategies can increase the effectiveness of certain transit strategies: managed lanes can facilitate express buses or bus rapid transit, for example.

Land Use Strategies

Land development strategies have been used in some areas to manage transportation demand on the system, and to help agencies meet air quality conformity standards. Land development strategies can include limits on the amount and location of development until certain service standards are met, or policies that encourage development patterns better served by public transportation and non-motorized modes. These strategies may help decrease the number and length of trips made (Figure 2.5). Table 2.5 presents the land development strategies that may be applicable for the Kansas City region. These
are often paired with Parking Strategies and can complement Active Transportation Strategies.

**Figure 2.4  Vehicle Miles Traveled versus Residential Density**

![Graph showing Vehicle Miles Traveled versus Residential Density](source: Best Practices in Transportation Demand Management, Seattle Urban Mobility Plan)

**Parking Strategies**

Parking management is most often used to decrease automobile trips for both work and non-work purposes, although in the context of enforcement it may also be used to improve traffic flow (Table 2.6). Often, policies implemented by local governments and directed towards the private sector must be accompanied by incentives in order to ensure their effectiveness. These are often closely linked with Land Use Strategies and Transportation Demand Management (TDM) Strategies.

**Regulatory Strategies**

Regulatory Strategies, shown in Table 2.7, are low- or no-cost policy decisions that affect each of the strategy categories above. This could include pricing, vehicle restrictions, insurance schemes, and others.

**TDM Strategies**

Transportation demand management (TDM) strategies are used to reduce travel during the peak commute period. They are also used to help agencies meet air quality conformity standards, and are intended to provide ways to provide congestion relief and mobility improvements without high cost infrastructure projects by focusing on the demand, rather than supply, side. Pricing strategies,
such as congestion pricing, are included in this group (Figure 2.6). Table 2.8 presents the TDM strategies that may be applicable for the Kansas City region.

**Figure 2.5  TDM Strategies: Congestion Pricing**

Source: Minnesota Department of Transportation

**Transit Strategies**

Transit services and infrastructure projects have traditionally been implemented in regions to provide an alternative to automobile travel potentially reducing peak-period congestion and improving mobility and accessibility for commuters. Table 2.9 presents the transit projects that may be applicable for the Kansas City region. These projects tend to reduce systemwide VMT in relatively small increments but do improve corridor and systemwide accessibility, improve roadway travel times, and decrease congestion on the roadway system: successful treatments can greatly increase the people transported within a given roadway (Figure 2.7). Transit Strategies are more effective when paired with effective transportation system management (TSM) in Transportation Operations and Management Strategies, pedestrian approaches in Active Transportation Strategies, and Land Use Strategies.
Transportation Operations and Management

Intelligent transportation system (ITS) and transportation system management (TSM) strategies have traditionally focused on improving the operation of the transportation system without major capital investment and cost. While ITS strategies may be costly compared to more traditional TSM strategies, their relative congestion-reduction impacts can be significant. These strategies also tend to be complementary. Table 2.10 presents the ITS and TSM strategies that may be applicable for the Kansas City region. The strategies can build upon current ITS initiatives in the Kansas City region such as the Kansas City Scout Program and Operation Green Light.

  • Improve mobility on facility  
  • Improve travel times and decrease delay for through traffic  
  • Fewer incidents                                                                 | Low to moderate: Implementation and maintenance costs vary                  | Short-term: 1 to 5 years (includes planning, engineering, and implementation)         | • Localized Analysis                                                                 | • Operations and Management strategies                          | • NYMTC   |
| **Access Control to Available Development Sites** | • Increase capacity, efficiency on arterials  
  • Improve mobility on facility  
  • Improve travel times and decrease delay for through traffic  
  • Fewer incidents                                                                 | Low to moderate: Implementation and maintenance costs vary                  | Short-term: 1 to 5 years (includes planning, engineering, and implementation)         | • Localized Analysis                                                                 | • Operations and Management strategies                          | • NYMTC   |
| **Intersection Turn Lanes**               | • Greater number of vehicles can pass through the intersection in given amount of time, resulting in a lower level of travel delays and stopped time  
  • Can reduce the likelihood of rear-end crashes                                                                                 | Low to moderate: depends on right-of-way needs.  
  • Medium-term: 5-10 years (agencies must be sure to plan for possible time needed to obtain right-of-way) | • Localized Analysis                                                                 | • Operations and Management strategies                          | • DRCOG                                                             |           |
### Roundabout Intersections

An intersection modification that does not use traffic signal or stop sign controls. Provides continuous movement via entrance and exit lanes to/from a typically circular distribution roadway.

- Greater capacity than traditional 3- or 4-way intersections in many situations
- Fewer crashes over time
- Lower air pollutant emissions due to fewer stopped vehicles

**Medium-term: 5-10 years** (completion time for a replacement roundabout is related to the amount of planning and public outreach time needed and the right-of-way acquisition process)

**Operations and Management strategies**

**DRCOG**

### New Grade-Separated Intersections

An overpass or underpass for one roadway to avoid intersecting with a cross street.

- Increase capacity, efficiency on arterials
- Improve mobility on facility
- Improve travel times and decrease delay for through traffic
- Fewer incidents

**High: Cost depends on the amount of right-of-way needed and the scale of construction impediments.**

**Medium- to long-term: 5-15 years** (includes planning, engineering, and implementation)

**Operations and Management strategies**

**DRCOG**

**Localized Analysis**

</table>
|                     | • Increase capacity, reducing congestion in the short term  
• Long-term effects on congestion depend on local conditions  
• Reduced traffic and congestion on parallel streets                                                                                                               | Low to Moderate (capital costs depend on extent of modifications needed; maintenance costs increase) | Short-term: 1 to 5 years (includes planning, engineering, and implementation)           | Regional Travel Model | • Active traffic management strategies  
(Transportation operations and management strategies)                      | MARC NYMTC |
| Increasing Number of Lanes without Highway Widening                      |                                                                                                                                  |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | Takes advantage of “extra” width in the highway cross section used for broken lanes or median.                                                                                                                                                              |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     |                                                                                                                                  |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | Geometric Design Improvements                                                                                                                                                                                                               |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | Includes widening to provide shoulders, additional turn lanes at intersections, improved sight lines, auxiliary lanes to improve merging and diverging.                                                                                                                |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | Interchange modifications to decrease weaving sections on a freeway, paved shoulders and realignment of intersecting streets. Adding turning lanes or through lanes at an intersection, realignment of intersection streets, intersection channelization, or modifying intersection geometries to improve overall efficiency and operation. |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | HOV Lanes                                                                                                                                                                                                                                    |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | Increases corridor capacity while at the same time provides an incentive for single-occupant drivers to shift to ridesharing. These lanes are most effective as part of a comprehensive effort to encourage HOVs, including publicity, outreach, park- and ride lots, and rideshare matching services. |                                                                                 |                                                                                        |                       |                                                                         |           |
|                     | • Reduce regional VMT  
• Reduce regional trips  
• Increase vehicle occupancy  
• Improve travel times  
• Increase transit use and improve bus travel times                                                                                                               | Moderate to High (depends on extent of additional ROW costs, barrier separation costs; operations and enforcement costs) | Medium-term: 5 to 10 years (includes planning, engineering, and construction)           | Regional Travel Model | • Active traffic management strategies

## Congestion Management Toolbox Update

**New Freeways**
- Construction of new, access-controlled, high-capacity roadways in areas previously not served by freeways.
  - Reduce arterial street network congestion
  - Reduce travel times & delay
  - High (Cost varies by type of highway constructed; in dense urban areas can be very expensive)
  - Can create environmental and community impacts
  - Long-term: 10 or more years (includes planning, engineering, and construction)
  - Regional Travel Model
  - Simulation Model
  - Transportation operations and management strategies
  - MAG

- Construction of new, access-controlled, high-capacity roadways in areas previously not served by freeways.
  - Reduce arterial street network congestion
  - Reduce travel times & delay
  - High (Cost varies by type of highway constructed; in dense urban areas can be very expensive)
  - Can create environmental and community impacts
  - Long-term: 10 or more years (includes planning, engineering, and construction)
  - Regional Travel Model
  - Simulation Model
  - Transportation operations and management strategies
  - MAG

**New Arterial Streets**
- Construction of new, higher-capacity roads designed to carry large volumes of traffic between areas in urban settings.
  - Provide connectivity
  - Carry traffic from local & collector streets to other areas
  - Increase capacity, reducing congestion in the short term
  - Long-term effects on congestion depend on local conditions
  - Moderate to High (Construction and engineering costs substantial; grade separate, other design features)
  - Maintenance variable based on urban region
  - Can create environmental and community impacts
  - Medium-term: 5 to 10 years (includes planning, engineering, and construction)
  - Regional Travel Model
  - Simulation Model
  - Transportation operations and management strategies
  - MAG

**New Collectors and Local Streets**
- Construction of new roadway along separate right-of-way to serve newer developed or developing areas.
  - Increased capacity to serve developing areas
  - Reduced traffic and congestion on parallel streets due to vehicles diverted to the new road and increased access/connectivity to local destinations
  - Moderate to High (Cost depends on amount of right-of-way needed and the scale of construction impediments)
  - Medium-term: various, but likely around 5 years (includes planning, engineering, and construction)
  - Regional Travel Model
  - Simulation Model
  - Access management strategies
  - Consider incorporating transit treatments, as appropriate
  - Land use practices
  - DRCOG

**Accelerator/Decelerator lanes**
- Deceleration lane provided on a freeway just before an exit on-ramp allows vehicles to reduce speed outside the through lanes.
  - Acceleration lane provided as an extension of a freeway on-ramp or an arterial street turn-lane for vehicles to increase speed and merge more smoothly into the through-lane.
  - Slower-moving turning or exiting vehicles are removed from through-lanes resulting in fewer delays for upstream traffic
  - Accelerating vehicles are provided more distance to reach the speed of through traffic, resulting in fewer delays caused by merging and weaving vehicles
  - In certain situations, can greatly reduce delays (caused by braking) for upstream vehicles during peak traffic flow periods
  - Low to moderate (Cost is relatively low if right-of-way or bridge widening is not required)
  - Medium-term: 5 to 10 years
  - Regional Travel Model
  - IDAS
  - Hill climbing lanes
  - DRCOG

**Hill Climbing Lanes**
- Additional lanes provided for a short distance to allow slower-moving vehicles (e.g., trucks and recreational vehicles) to move to the right and allow faster-moving vehicles to pass
  - Major travel time savings for vehicles on rural highways, especially those with peak levels of recreational traffic
  - Safety benefits due to fewer frustrated drivers making dangerous passing maneuvers
  - Low to moderate (Cost is relatively low unless right-of-way, major rock cuts or environmental mitigation is required)
  - Short- to medium-term: 1 to 10 years (Shorter segments with no right-of-way needs can be done in a short time)
  - Simulation model or HCM software
  - Acceleration/deceleration lanes
  - DRCOG

**Grade separated railroad crossings**
- Roadway underpass or overpass of a railroad line
  - Significant reduction in travel delays at high volume locations
  - Likely elimination of car-train crashes
  - High (Cost is very high to provide either a roadway or railroad bridge or tunnel)
  - Medium- to long-term: 5 to 10+ years (Implementation requires significant negotiation with railroads and local communities)
  - Simulation model
  - Other highway strategies
  - DRCOG

**Collection of tools and strategies**

<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mixed-Use Development</strong></td>
<td>Allows multiple land use types within a single development or district, rather than completely segregating land uses. It facilitates the reduction of trip length and increase of walking trips.</td>
<td><strong>Low/Moderate</strong></td>
<td>Public costs to set up and monitor appropriate ordinances; Economic incentives used to encourage developer buy-in; Regional savings in reduced new infrastructure development</td>
<td>Short- to long-term: development can begin immediately as long as regulations and zoning allow, but requires longer period to reach full development.</td>
<td>Regional Travel Model</td>
<td>Transit strategies</td>
</tr>
</tbody>
</table>

| **Infill and Densification** | Takes advantage of existing infrastructure by encouraging development on vacant or underused parcels in already developed areas; this avoids requiring new construction of infrastructure on the fringes of the urban area. | **Low/Moderate** | Public costs to set up and monitor appropriate ordinances; Economic incentives used to encourage developer buy-in; Regional savings in reduced new infrastructure development | Short- to long-term: development can begin immediately as long as regulations and zoning allow, but requires longer period to reach full development. | Regional Travel Model | Transit strategies | MARC, NYMTC, SLC, WFRC |

| **Transit-Oriented Development** | This clusters housing units and/or businesses near transit stations in walkable communities. | **Low/Moderate** | Public costs to set up and monitor appropriate ordinances; Economic incentives used to encourage developer buy-in; Regional savings in reduced new infrastructure development | Short- to long-term: development can begin immediately as long as regulations and zoning allow, but requires longer period to reach full development. | Regional Travel Model | Transit strategies | MARC, NYMTC, MAG, SLC, WFRC |

| **Trip Reduction Strategies** | Plans, policies, and regulations instituted to reduce the use of SOVs for commuting; often linked to air quality planning and employer-based. | **Low** | First-year implementation costs for private-sector (per employee equipment); Second-year costs tend to decline; Requires interagency and private sector coordination | Short-term: 1 to 5 years | EPA Commuter Model | Transit strategies | MAG |

| **Transportation Management Associations** | Nonprofit, member-controlled organizations that provide transportation services in a particular area, such as a commercial district, mall, medical center, or industrial park. They are generally public-private partnerships consisting primarily of area businesses with local government support. | **Low** | First-year implementation costs for private-sector (per employee equipment); Second-year costs tend to decline; Requires interagency and private sector coordination | Short-term: 1 to 5 years | EPA Commuter Model | Transit strategies | MAG |

• Reduce VMT | Low-Moderate. Land acquisition, construction and maintenance are necessary for park-and-ride lots. | Short-term: 1 to 5 years | TDM Evaluation Model | Transit strategies | • NYMTC                  |
| **Advanced Parking Systems**                  | • Reduce congestion on local streets  
Some peak-period travel and shift to non-auto modes | Low-Moderate. Costs vary based on system complexity | Short-term: 1 to 5 years | • Regional Travel Model  
TDM Evaluation Model | • Transit strategies  
Increasing transit/bus route coverage and frequency  
Intelligent transit stops  
Enhanced transit amenities | • NYMTC                  |
| **Local and Regional Excise Taxes**            | • Generate revenue to maintain system and to address transportation improvements regionwide  
• Reduce congestion  
• Increase non-auto mode shares | Minimal | Short-term: 1 to 5 years (depends on political factors) | • Land Use and Built Environment (e.g., Combined land use and transportation strategies)  
Transportation Demand Management  
Operations and Management (e.g., traveler information) | • Land Use and Built Environment (e.g., Combined land use and transportation strategies)  
Transportation Demand Management  
Operations and Management (e.g., traveler information) | • Oregon DOT                  |
### Parking Facility Management Information Signs

- Signage to notify travelers of the remaining number of unoccupied parking spaces at a public (e.g., park-and-ride) or private parking lot, guiding them to available parking.

- Decreased total travel delay and miles wasted driving around to find a parking spot.
- Improves convenience of transit if used at park-and-ride lots.

- Low (Simple parking management systems can be as inexpensive as $20,000, whereas more sophisticated management programs can cost more than $250,000 to purchase and implement)

- Short-term: 1 to 3 years

- Transit strategies (Park-and-ride)

- Operations and Management

- DRCOG

**Carbon Pricing: Motor Fuel Tax**

Carbon pricing considers an economy wide or system strategy set either as a fuel tax or as a result of a cap-and-trade system. Motor fuel taxes, currently the primary source of revenue for highways, would increase to higher levels to generate more revenue to highways. Very high levels of either carbon prices or motor fuel taxes may affect fuel efficiency or fuel types, as well as travel demand. Carbon pricing strategies, while not implemented, consider:

- Environmental levy on the carbon content of fuels; and
- Dedicated fuel consumption tax to support development and maintenance of new and existing transportation systems.

State DOTs with federal (U.S. DOT, FHWA) agency support have been assessing the potential for implementing carbon pricing strategies. An example pricing strategy could include an allowance price of $30-50 per ton in 2030, or similar carbon tax.

</tbody>
</table>

**VMT fee**

A VMT Fee is charged based on how many miles a car is driven. Odometer readings determine the exact fee charged. A city or county could modify the structure of the fee to include a carbon fee (see Carbon Pricing/Motor Fuel Tax). VMT fees can be layered to be higher or lower based on the fuel economy of cars and also layered based on urban and rural usage. Specific VMT fees of 2 to 5 cents per mile have been tested.

VMT fees consider distance-traveled charges levied to users based on the amount a vehicle uses a road system, while Congestion Pricing/Road User fees are levied to system users during congested periods of the day.

<td>Minimal</td>
<td>Long-Term</td>
</tr>
</tbody>
</table>

**Traffic Impact Fee**

A charge on new development to cover the full cost of the additional transportation capacity, including transit, required to serve the development. While fee strategies may vary, in most cases, only those new developments that result in an increase in vehicle trips would be charged. Traffic impact fees can be structured as a single fee for the entire region, multiple fees for individual geographic areas, or multiple fees for specific corridors. Traffic impact fees vary based on the expected new development impact on the transportation system and are often structured with lower fees for developments that promote mixed use development, reduce single occupant vehicle use, and encourage transit and non-motorized travel use.

**Pay-As-You-Drive (PAYD) Insurance (state level)**

PAYD insurance considers charging drivers insurance premium costs based in part on annual vehicle miles travelled. Other insurance rating factors still apply to insurance rates, so high risk drivers pay more than lower risk drivers. All drivers have the opportunity to save money (reduced insurance fees) by driving fewer miles. The state could require insurance companies to offer PAYD insurance at lower rates and require companies to offer higher rates to encourage fewer vehicle miles travelled.

• Operations and Management strategies | • Oregon DOT |
| Car Sharing | • Provide cost savings to users  
• May increase non-auto mode share | High (costs may be privately funded; revenues may recover most costs over time) | Short-to-Medium-Term: Implemented within 1 to 2 years or between 3 to 10 years depending on the level of service changes and magnitude of project. | • Other Transportation Demand Management strategies  
• Transit strategies  
• Active Transportation strategies  
• Land Use strategies | • Oregon DOT |

Ed. note: Traditional Toll Roads and Non-traditional Toll Roads are not the same. Non-traditional Toll Roads use the term “Managed Lanes,” which are toll lanes or lanes designed to increase freeway efficiency through a combination of operational and design actions. This may include High Occupancy Vehicle (HOV) toll (HOT) lanes that allow a limited number of low-occupancy vehicles to use the lane if a fee is paid.

Payment charged for passage on roads, bridges or ferries that carry cars. Primary use as a revenue generator to help pay for building new facilities and maintaining infrastructure. Often associated with bonding for infrastructure.

Program in which automobile rental services are used to substitute private vehicle use and ownership. Programs are designed to be accessible to residences, affordable, follow easy check-in/check-out processes, and reliable.

Peer to peer car sharing, also known as Personal Vehicle Car-Sharing (PVCS) enables private car owners to make their vehicle available on a temporary basis to a private carsharing company for rental. In return, the vehicle owner gets a substantial portion of the rental revenue from the carsharing company. When not rented, the vehicle owner can continue to use their car as before.

Commercial Car Sharing, run by private firms, maintain a fleet of vehicles that are deployed regionally (neighborhoods) for rental and use.

| Reducing Transit Fares                     | • Reduce daily VMT  
• Reduce congestion  
• Increase ridership                                                                                 | Low to Moderate (Operating subsidies needed to replace lost fare revenue; total operating costs may increase if ridership increases). | Short-term: Less than one year                  | Regional Travel Model            | Other transit strategies        | MARC, NYMTC   |
| Increasing Bus Route Coverage or Frequencies | • Increase transit ridership  
• Decrease travel time  
• Reduce daily VMT  
• Improved convenience and travel reliability  
• Reduced traffic congestion due to trips switched from driving alone to transit | Low to Moderate (New bus purchases likely; increased operating costs)            | Short-term: 1 to 5 years (includes planning, engineering, and construction)      | TDM Evaluation Model              | Regional Travel Model           | MARC, NYMTC, DRCOG, MAG     |
| Park-and-Ride Lots                         | • Reduce regional VMT (up to 0.1 percent)  
• Increase mobility and transit efficiency  
• Reduce SOV trips  
• Increase transit boardings and mode share  
• Decrease congestion by increasing vehicle occupancy rate | Low to Moderate (Structure costs for transit stations; Land acquisition costs)    | Medium-term: 5 to 10 years (includes planning, engineering, and construction)     | TDM Evaluation Model              | Regional Travel Model           | MARC, NYMTC, MAG, SLC WFRB |
| Light, Heavy, and Commuter Rail            | • Reduce daily VMT  
• More consistent and sometimes faster travel times versus driving  
• Reduce SOV trips  
• Increased person throughput capacity within a corridor due to people switching from single occupant motor vehicles to transit  
• Stimulation of efficient mixed-use or higher-density development | Moderate to high (Implementation cost will vary, but cost could be high due to acquisition of rights-of-way, materials and infrastructure.  
• New systems require large upfront capital outlays and ongoing operating costs) | Medium- to long-term: Development and implementation of a rail project is a major undertaking that can take 10 or more years from initial planning phases through NEPA studies to an opening day. | Regional Travel Model             |                                | DRCOG, MAG     |
| Employer Incentive Programs                | • Increase transit ridership  
• Decrease travel time  
• Decrease daily VMT                                                                                   | Low to Moderate (Cost of incentives to employers offering employee benefits for transit use) | Short-term: 1 to 5 years                         | TDM                              | Other transit strategies        | NYMTC         |
| Electronic Payment Systems and Universal Farecards | • Increase transit ridership  
• Decrease travel time  
• Decrease operating costs                                                                          | Moderate to High (Implementation costs vary based on system design and functionality)  
• The cost to purchase and implement electronic fare collection equipment can be high depending on the technology used.  
• An initial surge in the maintenance and repair of electronic fare equipment can be expected due to the need for highly trained personnel. | Short-term: 1 to 5 years                         | Other transit strategies           |                                | NYMTC, DRCOG |

**Grouping**

- **Land use strategies**
- **Parking strategies**
- **Other transit strategies**
- **HOV lanes**
- **Active transportation strategies**
- **Highway pricing strategies**
| Service adjustments to better align transit service with ridership markets |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| Realigned Transit Service Schedules and Stop Locations |
| • Increase transit ridership | • Decrease daily VMT | Low | Short-term: 1 to 5 years | • Regional travel model | • Other transit strategies | • NYMTC |

| Intelligent Transit Stops |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| Ranges from kiosks, which show static transit schedules, to real-time information on schedules, locations of transit vehicles, arrival time of the vehicle, and alternative routes and modes |
| • Decrease daily VMT | • Decrease congestion | • Increase ridership | Low to Moderate (Capital and operating costs for new infrastructure and technology) | Medium-term: 5 to 10 years (includes planning, engineering, and construction) | • Other transit strategies | • NYMTC |

| Transit Intersection queue jump lanes and signal priority |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| Includes vehicle replacement/upgrades and better shelters or stations, which furthers the benefits of increased transit use |
| • Reduced bus travel delays due to traffic signals and traffic congestion | • Improved operational efficiency of transit service within a corridor | • Increased ridership and reduced congestion due to time savings | • Safer driving conditions for all vehicles due to fewer severe and sudden lane changes by buses | • Localized analysis | • Other transit strategies | • DRCDG | • NYMTC |

| Enhanced Transit Amenities |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| Includes vehicle replacement/upgrades and better shelters or stations, which furthers the benefits of increased transit use |
| • Decrease daily VMT | • Decrease congestion | • Increase ridership | Low to Moderate | Short-term: 1 to 5 years (includes planning, engineering, and construction) | • Other transit strategies | • NYMTC |

| Dedicated Rights-of-Way for Transit |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| Reserved travel lanes or rights-of-way for transit operations, including use of shoulders during peak periods |
| • Increase transit ridership | • Decrease travel time | Low to Moderate (Costs vary by type of design) | Medium-term: 5 to 10 years (includes planning, engineering, and construction) | • Simulation model | • Other transit strategies | • NYMTC |

| Bus Rapid Transit (BRT) |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| High-capacity, highly efficient bus service designed to compete with rail in terms of quality of service. |
| • Reduce VMT | • Reduce SOV trips | • Increase transit ridership & mode share | Moderate to High (Depends on elements of BRT implemented) | Long-term: 10 or more years (includes planning, engineering, and construction) | • Regional Travel Model | • Other transit strategies | • MAG |

| Express Bus Service |
|---------------------|----------------|------------------|-----------------|----------------------------|-------------------|
| Bus service with high-speed operations, usually between two commuter points. |
| • Reduce VMT | • Reduce SOV trips | • Increase transit ridership & mode share | Low to Moderate (may require new bus purchases) | Short-term: 1 to 5 years (includes planning, engineering, and construction) | • Regional Travel Model | • Other transit strategies | • MAG |

</table>
| **Traffic Signal Coordination and Modernization** | - Improve travel time  
- Reduce the number of stops  
- Reduce VMT by vehicle miles per day, depending on program  
- Reduce vehicle-hours traveled  
- Reduce air pollution, fuel consumption and travel time  
- Increase "capacity" of an intersection |
|                                       | Low to moderate (Costs include initial investment of equipment, software, and communication network and connections, and O&M costs per signal. Varies depending on required equipment) |
|                                       | Short-term: 1 to 5 years (includes planning, engineering, and implementation)                     | IDAS Regional Travel Model  
- TOPS-BC  
- Microsimulation models | Other Operations and Management strategies  
- Transit strategies |
| **Reversible Traffic Lanes**          | - Increase peak direction capacity  
- Reduce peak travel times  
- Improve mobility                                                                                     | Moderate to high (depends on barrier separated costs and operation costs per mile) | Short-term: 1 to 5 years | Regional Travel Model  
- Microsimulation models | Other Operations and Management strategies | MARC  
- NYMTC |
| **Freeway Incident Detection and Management Systems** | - Reduce accident delay  
- Reduce travel time  
- Decrease vehicle-hours traveled | Moderate to high (capital costs variable and can be substantial; also annual operating and maintenance costs) | Medium- to Long-term: likely 10 years or more | IDAS Regional Travel Model  
- Microsimulation models | Other Operations and Management strategies | MARC  
- NYMTC  
- DRCOG |
| **Ramp Metering**                     | - Decrease travel time  
- Decrease merging and weaving related crashes  
- Improve traffic flow on major facilities  
- Improved speed on freeway  
- Decreased crash rate on freeway                                                                       | Moderate (capital costs variable, can be significant costs associated with enhancements to centralized control system; also annual operating and maintenance costs) | Medium-term: 5 to 10 years | IDAS Regional Travel Model  
- TOPS-BC  
- Freerval (specialized ramp metering tool)  
- Microsimulation models | Other Operations and Management strategies | MARC

## Congestion Management Toolbox Update

### Service Patrols
Service vehicles patrol heavily traveled segments and congested sections of the freeways that are prone to incidents to provide faster and anticipatory responses to traffic incidents and disabled vehicles

<table>
<thead>
<tr>
<th>Benefit</th>
<th>Cost/Benefit</th>
<th>Implementation</th>
<th>Analysis</th>
<th>Agency</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Reduce incident duration time</td>
<td>Low to moderate</td>
<td>Short-term: 1 to 5 years</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
<tr>
<td>- Restore full freeway capacity</td>
<td>Low to moderate</td>
<td>Short-term: 1 to 5 years</td>
<td>Microsimulation models</td>
<td>NYMTC</td>
</tr>
<tr>
<td>- Reduce the risks of secondary crashes to motorists</td>
<td>Low to moderate</td>
<td>Short-term: 1 to 5 years</td>
<td>Microsimulation models</td>
<td>NYMTC</td>
</tr>
</tbody>
</table>

### Restricting Turns at Key Intersections
Limits turning vehicles, which can impede traffic flow and are more likely to be involved in crashes

<table>
<thead>
<tr>
<th>Benefit</th>
<th>Cost/Benefit</th>
<th>Implementation</th>
<th>Analysis</th>
<th>Agency</th>
</tr>
</thead>
<tbody>

<td>NYMTC</td>
</tr>
<tr>
<td>- Increased mobility due to restored capacity, delay reductions, and more uniform traffic flow</td>
<td>Low to moderate</td>
<td>Short-term: 1 to 5 years</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
</tbody>
</table>

### Traffic Surveillance and Control Systems
Often housed within a Traffic Management Center (TMC), monitors volume and flow of traffic by a system of sensors, and further analyzes traffic conditions to flag developing problems, and implement adjustments to traffic signal timing sequences, in order to optimize traffic flow using traffic parameters in real-time. Currently, the dominant technology traffic surveillance is that of magnetic loop detectors, which are buried underneath roadways and count vehicles passing over them. Video monitoring systems for traffic surveillance may provide vehicle classifications, travel times, lane changes, rapid accelerations or decelerations, and length queues at urban intersections, in addition to vehicle counts and speeds.

<table>
<thead>
<tr>
<th>Benefit</th>
<th>Cost/Benefit</th>
<th>Implementation</th>
<th>Analysis</th>
<th>Agency</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Decrease travel times and delay</td>
<td>Moderate (Installation of video surveillance cameras may be less expensive than magnetic loop detectors, which require disruption and digging of the road surface)</td>
<td>Medium-term: 5 to 10 years</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
<tr>
<td>- Some peak-period travel and mode shift</td>
<td>Moderate (Installation of video surveillance cameras may be less expensive than magnetic loop detectors, which require disruption and digging of the road surface)</td>
<td>Medium-term: 5 to 10 years</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
</tbody>
</table>

### Electronic Toll Collection (ETC)
Equipment that electronically collects tolls from users without requiring vehicles to stop at a toll booth

<table>
<thead>
<tr>
<th>Benefit</th>
<th>Cost/Benefit</th>
<th>Implementation</th>
<th>Analysis</th>
<th>Agency</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Fewer vehicle stops and less traveler delay at toll stations</td>
<td>Moderate to high (Initial investment in electronic toll collection technology can be substantial, for overhead transponder readers, surveillance and enforcement equipment; estimated annual maintenance and operational costs for an electronic toll lane are less than $20,000, whereas a staffed toll booth lane can cost nearly $200,000 annually)</td>
<td>Short-to-medium-term: Physical implementation of electronic toll collection equipment can be completed in a short time period for a roadway, unless additional right-of-way is needed</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
<tr>
<td>- Cost savings due to no (or fewer) toll booth facilities or lanes</td>
<td>Moderate to high (Initial investment in electronic toll collection technology can be substantial, for overhead transponder readers, surveillance and enforcement equipment; estimated annual maintenance and operational costs for an electronic toll lane are less than $20,000, whereas a staffed toll booth lane can cost nearly $200,000 annually)</td>
<td>Short-to-medium-term: Physical implementation of electronic toll collection equipment can be completed in a short time period for a roadway, unless additional right-of-way is needed</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
<tr>
<td>- Significant decrease in pollutant emissions from stop-and-go traffic at toll booths/plazas</td>
<td>Moderate to high (Initial investment in electronic toll collection technology can be substantial, for overhead transponder readers, surveillance and enforcement equipment; estimated annual maintenance and operational costs for an electronic toll lane are less than $20,000, whereas a staffed toll booth lane can cost nearly $200,000 annually)</td>
<td>Short-to-medium-term: Physical implementation of electronic toll collection equipment can be completed in a short time period for a roadway, unless additional right-of-way is needed</td>
<td>Other Operations and Management strategies (Freeway Incident Detection and Management Systems; Highway Information Systems)</td>
<td>NYMTC</td>
</tr>
</tbody>
</table>
### Cordon Area Congestion Fees

An established cordon area or zone in which vehicles are charged a fee to enter. Such a fee can be variable (by time of day) or dynamic (based on real-time congestion conditions). Should include electronic payment/collection methods using cameras or transponders.

- Reduced pollution and congestion within the cordon area
- Revenues for roadway maintenance and new transit, bicycle and pedestrian facilities
- Overall reduced congestion due to less VMT
- Shift to non-auto modes

<table>
<thead>
<tr>
<th>High</th>
<th>Medium-to-long-term: Extensive time is required for the entire process including political and public discussions, possible ballot measures, construction and implementation</th>
<th>Regional or subareas travel demand models</th>
</tr>
</thead>
<tbody>

<td></td>
<td>Other Operations and Maintenance strategies</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Regulatory strategies</td>
</tr>
</tbody>
</table>

### Roadway Signage Improvements

Adequate or additional signage that facilitates route finding and the decision-making ability of roadway users. Signs with clearer/larger lettering that can be read from a greater distance.

- Reduced delay for upstream approaching vehicles
- Less chance of crashes caused by sudden lane changes, extremely slow-moving vehicles or sudden stops

<table>
<thead>
<tr>
<th>Low</th>
<th>Short-term: Production of signs and installation can occur shortly after site visits and design of new signing plans. Design should follow the guidance of the Manual on Uniform Traffic Control Devices (MUTCD).</th>
<th>DRCOG</th>
</tr>
</thead>
</table>

### Communications Networks and Roadway Surveillance Coverage

Base infrastructure (fiber, cameras, etc.) required to support all operational activities; Communications networks that allow remote roadway surveillance and system control from a TMC and provision of data for immediate management of transportation operations and distribution of information. Communication networks are essential to get the most efficiency and capacity out of the existing transportation system.

- Increased capability for regional-level coordination of operations and traveler information.

<table>
<thead>
<tr>
<th>Moderate</th>
<th>Cost can be reduced when done in conjunction with a larger scale construction project</th>
<th>Medium-to-long-term: Small-scale items and opportunistic expansion can be done quickly. Larger-scale regional network components require more time for planning and funding</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>DRCOG</td>
</tr>
</tbody>
</table>

### Transit Vehicle Travel Information

Communications infrastructure, GPS technology, vehicle detection/monitoring devices and signs/media/Internet sites for providing information to the public such as the arrival times of the next vehicles.

- More satisfied customers and increased ridership due to enhanced and reliable information sources
- Improved operations and management of transit service

<table>
<thead>
<tr>
<th>Moderate</th>
<th>Costs are dependent upon communication networks, changing technologies and the number of fleet vehicles to be equipped</th>
<th>Medium-term: Time is required for detailed planning, design and funding procurement</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>DRCOG</td>
</tr>
</tbody>
</table>
